

Compiler Construction

Lecture # 02

Mr. Usman Wajid

usman.wajid@nu.edu.pk

January 24, 2023

National University
of Computer & Emerging Sciences

Background

- A language is a way to convey messages

Background

- A language is a way to convey messages
- A programming language consist of notations for describing communications to people and machines

Background

- A language is a way to convey messages
- A programming language consist of notations for describing communications to people and machines
- All the softwares as we know today are written in some programming languages

Background

- A language is a way to convey messages
- A programming language consist of notations for describing communications to people and machines
- All the softwares as we know today are written in some programming languages
 - High level languages:
 - Low leve languages:
 - Machine level languages:

Background

- A language is a way to convey messages
- A programming language consist of notations for describing communications to people and machines
- All the softwares as we know today are written in some programming languages
 - High level languages:
 - Low leve languages:
 - Machine level languages:
- Before a program is run, it must be translated into a form that is understandable by the computer

Background

- A language is a way to convey messages
- A programming language consist of notations for describing communications to people and machines
- All the softwares as we know today are written in some programming languages
 - High level languages:
 - Low leve languages:
 - Machine level languages:
- Before a program is run, it must be translated into a form that is understandable by the computer
- The system softwares the perform this translation are called compilers

A Compiler

- A compiler is a program that can read a program in one language
 - source language (source program)

A Compiler

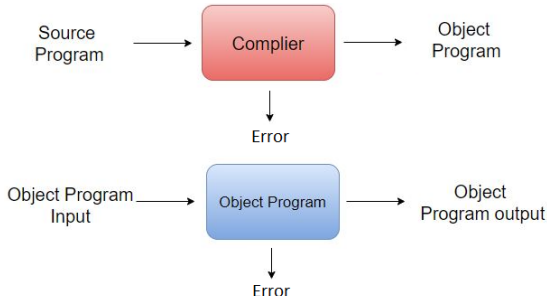

- A compiler is a program that can read a program in one language
 - source language (source program)
- Detect errors if any

A Compiler

- A compiler is a program that can read a program in one language
 - source language (source program)
- Detect errors if any
- Translate it into another language – target language (object program)

A Compiler

- A compiler is a program that can read a program in one language – source language (source program)
- Detect errors if any
- Translate it into another language – target language (object program)

An Interpreter

- An interpreter essentially works same as compiler except,

An Interpreter

- An interpreter essentially works same as compiler except,
 - It translates source program line by line

An Interpreter

- An interpreter essentially works same as compiler except,
 - It translates source program line by line
 - translates source program directly into machine language for immediate execution

An Interpreter

- An interpreter essentially works same as compiler except,
 - It translates source program line by line
 - translates source program directly into machine language for immediate execution
